# Obsessive Compulsive Disorder (OCD) in Children and Adolescents Ages 6 to 17 Years Old

## Level 0
Comprehensive assessment that includes screening for OCD symptoms and medical causes.

A comprehensive assessment before initiating treatment includes:

- Duration, type of course (e.g. episodic), and severity
- Family history (for OCD, tics, autoimmunity)
- Physical examination: Movements (tics or chorea), red hands, dysmorphology, inflamed throat
- If new and sudden onset, examine for clinical and subclinical infections, especially group A streptococcus and mycoplasma pneumonia and treat
- Review for most common comorbid presentations: ADHD, tics, separation anxiety, and ASD
- Specialty referral as appropriate, e.g., child psychiatry or for cognitive behavioral therapy (CBT)

**Associated conditions:**

- Health status: Infections, endocrine disorder, autoimmune
- Genetic disorder: Velocardiofacial Syndrome (VCFS), Wilson’s, CNV’s associated with OCD/tics
- Secondary to a medication or substance: Stimulants, atypical antipsychotics, montelukast, lamotrigine, etc.
- Trauma: physical, emotional, and sexual

## Level 1

1a. If mild to moderate OCD, start with CBT plus exposure response prevention (ERP) with qualified therapist.

1b. If moderate to severe OCD, start with combination of behavioral therapy (CBT + ERP) and approved SSRI such as sertraline, fluoxetine or fluvoxamine.

## Level 2
If inadequate response to CBT alone (at least 15 sessions) and mild to moderate OCD, add an approved SSRI (sertraline, fluoxetine, or fluvoxamine). If inadequate response to combination therapy after 10 to 12 weeks of optimized SSRI dosing and moderate to severe OCD, switch to another approved SSRI.

## Level 3

3a. If inadequate response after 10 to 12 weeks of optimized SSRI dosing, utilize another approved SSRI or consider clomipramine.

3b. Consider other non-FDA approved SSRI (e.g., escitalopram).

## Level 4
If treatment resistant to behavior therapy and/or SSRI, augment with low dose aripiprazole (0.5 to 3 mg/day) or clomipramine (10 to 50 mg/day).

</table>

*No FDA approval for OCD in children.
**No FDA approval for children.
*aConsider EKG monitoring especially if polypharmacy or higher doses.
*bSlow taper upon discontinuation.

OCD Treatment Considerations:

- A standard course of CBT with ERP is 10 to 15 sessions, 20 sessions if treatment refractory.
- OCD medication — time to full effect may be long (8-12 weeks) and incomplete (50% response).
- SSRI efficacy much less when in the context of comorbid conditions (especially tics and oppositional defiant disorder).

SSRIs and Dopamine-2 Blockers in Patients with Tics and OCD:

- In many patients with tics and OCD, combination pharmacotherapy is required (e.g., D2 blockers and SSRIs).
- There are almost no combination therapy trials in children with OCD/tics.
- Most data exist for risperidone and aripiprazole (low doses, i.e., much lower than those used in psychotic or bipolar disorders).
